

Recycling Infrastructure Grant Program

A portion of the State Energy Program funding was used to provide grants to increase the recycling infrastructure in Montana communities. Energy used to mine resources and manufacture goods can be reduced through recycling. In Montana, recycling is challenging because of long distances between communities and small population centers. The grant program was designed to encourage communities to work together to reduce transportation costs.

More than one million dollars in funding was requested by 44 applicants. \$312,000 in funding was available. \$308,000 was awarded to eighteen communities/organizations in thirteen counties. Funded projects will provide:

- o Seven balers to compact recyclable material in order to ship more weight per load
- o Four compartmentalized recycling trailers to collect material and transport to a regional recycling center
- o Eight roll-off containers that will be placed in rural communities for material collection
- o Five programs will purchase several hundred small and large collection containers to place various locations within communities
- o One Construction & Demolition material recovery program
- One densifier to process recycled plastic into a pelletized form that can be used by manufacturers of plastic products
- o One compactor that will be used to compact recycled cardboard
- o A professional film will be developed as part of an educational program for elementary school students
- o All of the funded projects include an educational component

To date most of the equipment has been ordered. A small percentage of the equipment has been delivered and is currently being installed.

The City of Colstrip and Powder River County were each awarded funding for a baler. Once their programs are in place they will develop a collaborative transportation system to move their community's recyclable materials to market. Eventually other communities, such as Forsyth, may join in the area's recycling network.

A grant to the Associated Students of Montana State University (ASMSU) will implement recycling at all major sporting events, trade shows, concerts and other large public gatherings. A long-term recycling strategy at public gatherings was a natural choice for MSU's student applicants. The largest venues on campus — the 10,000-seat Brick Breeden Field House and 15,000-seat Bobcat Stadium — will be the focus. Hundreds of thousands of people attending events each year will come in contact with this recycling project.

Flathead, Lincoln and Lake Counties are coordinating their recycling efforts through this grant program. A high population growth rate in the larger Flathead has dramatically shortened the life expectancy of the regional landfill. Flathead and Lake Counties joined with the cities of Polson and Libby to effectively collect, compact, transport and recycle a variety of commodities. The region's first e-waste event was recently conducted, and the area now recycles textiles.
